

## NSA-APPROVED DESTRUCTION DEVICES

1. This is a listing of equipment which NSA has evaluated as meeting the requirements for routine destruction of classified and sensitive paper COMSEC material, including high tensile strength paper tape, paper-mylar-paper tape and plastic key tape. Any machine that was previously tested and could successfully destroy P-M-P to secure residue levels may not destroy plastic key tape. Some of the larger disintegrators may be used for the destruction of non-MOS technology printed circuit boards. **NOTE:** It is the machine operator's responsibility to periodically inspect the resulting residue of each material destroyed for compliance with the secure particle standards. As new media (i.e. plastic key tape) are introduced, some machines that were previously tested and could successfully destroy materials such as P-M-P to secure residue levels, may not destroy this new material.
2. This approval is informational and advisory only. The approval is based on an examination of residue and physical security evaluation of the equipment. Such factors as reliability, rate of wear, and frequency of parts replacement have not been evaluated; and NSA does not endorse manufacturer's claims concerning these aspects. Hourly volume rates are estimates based on average rates for destruction of paper material and may vary depending on variety, volume, and loading.
3. Do not use devices in this listing for the destruction of microcircuits, floppy disks, hard disks, microfiche, microfilm, or other high density magnetic, optical, or reduction film material unless explicitly specified.
4. Much of the equipment identified in this listing is available from the GSA Federal Supply Schedule.
5. Devices in this listing which are identified as "No Longer in Production" may still be used only if the machines are in good working condition and can be properly maintained. Parts and service are typically available for at least five (5) years after production ends. Please consult your local service facility for the availability of service and parts for older equipment before accepting them for reuse.
6. Inclusion of an equipment in this listing does not constitute NSA or U.S. Government endorsement or lack thereof, of commercially available products. This listing is intended for use by elements of the Department of Defense, U.S. Government Departments or Agencies, U.S. Government contractors, and the listed manufacturers and distributors.

SEM Model 1				

## NOTES:

1. Wet Pulper devices are for Water Soluble Paper Only.
2. Do not use shredder devices for destruction of rigid plastic/fabric devices, as security and safety hazards may result.
3. EBA Cross Cut Model designated by C: .8mm x 12mm is the only C model that has passed the evaluation.
4. This is only for CD media that is formatted using the Phillips/Sony Standards and Cross-interleaved Reed Solomon Error Correction Code Encoding. There are basically two types of CD media, that which you can not record on (e.g. Read Only (ROM)) and that which you can record on (CD-R). CD-R is broken down into two categories, Write Once (WO), and re-writable (RW). Each type (e.g. CD-ROM, CD-WO, and CD-RW) has a unique construction and each must be examined separately in the destruction process to be certain that the process or equipment can adequately destroy each type. If any of the ancillary components of the CD package (e.g. CD case, jewel case, paper insert) are marked with or contain any classified information, then those materials must be destroyed according to the standards set for those individual materials and information.
5. SEM has developed a new Sound Deadening Safety Hopper for its new machines; it may be retrofitted to existing machines.
